
Exact and asymptotic steady states of aggregation equations with power-law potentials

Yanghong Huang^{*†1} and Carrillo Jose¹

¹Imperial College London – United Kingdom

Abstract

Despite the rich steady patterns observed in nonlocal interaction models, there are very few steady solutions with explicit closed expressions. In this talk, several exact solutions are presented for the aggregation equation with power-law potential, using explicit inverse of some singular integral operators. The asymptotic behaviours near the boundary are also discussed.
